HYPERBARIC REJUBELLE

Hyperbaric Oxygenation

Hyperbaric oxygenation is a normalizer and regulator of all biological functions: it elevates the immune system, tones the skin and prevents or corrects hypoxia (oxygenation deficiency).

The biological reality is that over the years the ability to breathe well is lost and this results in a generalized decrease in the level of internal oxygenation of the organism at the tissue level, very slow and imperceptible decrease that is undermining the body and it can reach anoxia (lack of oxygen).

Hyperbaric oxygen therapy consists of breathing oxygen in a pressure chamber in which atmospheric pressure rises up to three times more than normal. Under these conditions, the lungs can breathe up to three times more oxygen than would be possible to breathe under normal pressure.

The sessions can be spaced. Its number and periodicity depends logically on the age, the general state of health, the habits of the person and the individual response.

Hyperbaric oxygenation, even in the absence of symptoms or signs of disease, is a normalizer or regulator of the biological functions of the organism.
